Problem

Due to rising in the disbelief of scientific data regarding vaccinations and their safety/benefits. There has been an increased spread of infections and potentially fatal diseases. An example of this issue is the recent outbreak of the measles virus in the New Zealand city of Christchurch. Currently, there is a lack of education and information reaching the New Zealand population regarding vaccinations.

Solution

Eliminate misleading propaganda that can lead to serious health issues and fatalities by developing a multimedia application outlining statistics and information to better educate the New Zealand population on vaccinations as well as offering a discussion forum where users can discuss any concerns they have.
